Norm Niedergang, Chief RERB

Robert J. Bowden, Chief EERB

As a result of the Administrator's 90 day Management Review of the Superfund Program, the Emergency & Enforcement Response Branch conducted a site inspection of the subject NPL site to determine if any immediate removal actions are appropriate.

Attached is a copy of the Technical Assistance Team (TAT) report on this inspection.

The Interstate Pollution Control site is a four acre inactive waste storage facility which accepted a variety of industrial wastes between 1974 and 1982. There is a capped lagoon on the site.

During 1985, the FIT team documented heavy contamination in the groundwater on the site including VOCs, cyanide and heavy metals.

During 1988, the TAT found elevated levels of metals and cyanide in surface soils but the Agency for Disease Registry and Toxic Substances reported that the site posed no immediate risk.

During 1989, the TAT found that access to the site is unrestricted, stained surface soils, evidence of recent dumping, a 100,000 gallon storage tank (reportedly empty) and drums in a building on the site.

I recommend that we issue a 106 order to reestablished security on the site by repairing or replacing the fence and gates. If the order is unsuccessful we can use removal authority to reestablish site security since a direct contact threat exists.
